

# The Three Forms of a Quadratic Function (Parabola)

Dr William Larson, St. George's School in Switzerland

<u>Standard (or General) Form</u>	<u>Factored form</u>	<u>Vertex form</u>
$y = ax^2 + bx + c$	$y = a(x - \alpha)(x - \beta)$	$y = a(x - h)^2 + k$
<p>The <i>concavity</i> is determined by <math>a</math>.                      If <math>a &gt; 0</math> the parabola is concave up.                      If <math>a &lt; 0</math> the parabola is concave down.</p> <p>The <math>y</math>-intercept is <math>c</math>.</p> <p>The <i>axis of symmetry</i>, which is also the <math>x</math>-coordinate of the vertex, is <math>x = \frac{-b}{2a}</math>.</p> <p>To find the <math>x</math>-intercepts, solve <math>0 = ax^2 + bx + c</math>:  <math display="block">x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}</math></p> <p><b>To get this form from the other forms:</b>                      Multiply it out &amp; collect like terms.</p> <p><b>Example</b>  <math>y = -4x^2 + 2x - 3</math>  <math>a = -4, b = 2, c = -3</math></p> <p>The <math>y</math>-intercept is <math>(0, -3)</math>.</p> <p>The axis of symmetry is:  <math>x = \frac{-2}{2(-4)} = \frac{1}{4}</math>. So <math>x = \frac{1}{4}</math>.</p>	<p>Gives the <math>x</math>-intercepts: <math>x = \alpha, \beta</math>.</p> <p>To find the <math>y</math>-intercept set <math>x = 0</math> and evaluate.</p> <p>The <i>concavity</i> is determined by <math>a</math>.                      If <math>a &gt; 0</math> the parabola is concave up.                      If <math>a &lt; 0</math> the parabola is concave down.</p> <p>The <math>x</math>-coordinate of the vertex and the equation of the axis of the symmetry is the <u>average</u> of the <math>x</math>-intercepts, <math>\frac{\alpha + \beta}{2}</math>.</p> <p><b>To get this form from the other forms:</b> Factor it.</p> <p><b>Example</b>  <math>y = 2(x + 3)(x - 1)</math></p> <p>The zeros are <math>x = -3, 1</math></p> <p>The <math>x</math>-intercepts are <math>(-3, 0), (1, 0)</math></p> <p>The axis of symmetry is:  <math>x = \frac{-3 + 1}{2}</math>, so <math>x = -1</math>.</p>	<p>Gives the vertex: <math>(h, k)</math>.                      (Note the minus sign on <math>h</math>.)</p> <p>The axis of symmetry is <math>x = h</math>.</p> <p>The <i>concavity</i> is determined by <math>a</math>.                      If <math>a &gt; 0</math> the parabola is concave up.                      If <math>a &lt; 0</math> the parabola is concave down.</p> <p><b>To get this form from the other forms:</b> Complete the square.</p> <p>To find the <math>x</math>-intercepts set <math>y = 0</math> and solve for <math>x</math>.</p> <p>To find the <math>y</math>-intercept set <math>x = 0</math> and evaluate.</p> <p><b>Example</b>  <math>y = -3(x + 1)^2 - 4</math></p> <p>The vertex is <math>(-1, -4)</math></p> <p>The axis of symmetry is: <math>x = -1</math></p>

## The Four "Quadratic Equations"

There are four different mathematical objects that are sometimes called by students the "Quadratic Equation". Try to keep them straight.

<i>Quadratic Expression</i>	$ax^2 + bx + c$	It can be factored, but it cannot be "solved", because it's not an equation and only equations can be solved.
<i>Quadratic Equation</i>	$0 = ax^2 + bx + c$	It can be solved, possibly by factoring it.
<i>Quadratic Function</i>	$y = ax^2 + bx + c$	It cannot be "solved." It can be graphed and the $x$ -intercepts can be solved for, possibly by factoring it.
<i>Quadratic Formula</i>	$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$	The solution of the quadratic equation.

## Four statements about Quadratics

There are several ways of looking at the solutions of the quadratic equation  $0 = a(x - \alpha)(x - \beta)$ . The following are all the same statement:

1. The **zeros, roots** or **solutions** of a quadratic equation are  $\alpha$  &  $\beta$ .
2. The **factors** of the corresponding quadratic expression are  $(x - \alpha)(x - \beta)$ .
3. The **zeros** of the quadratic function are  $\alpha$  &  $\beta$ . These are the values of  $x$  that make  $y = 0$ .
4. The  **$x$ -intercepts** of the corresponding quadratic function are  $(\alpha, 0), (\beta, 0)$ .
